### **Detailed Action**

# Withdrawal of Finality of Last Office Action

Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

## Response to Arguments

Application's argue with respect to claims 1-27 have been considered but are moot in view of the new ground(s) of rejection.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 1,3 and 16 are rejected under 35 USC 103(a) as being unpatentable over Mishra D., (SNOOP: An Event Specification Language for Active Database System, Thesis from U. of Florida, 1991) in view of Yoshida (US Patent 6006213).
- 2. Regarding claim 1, Mishra teaches a computer-based method (Mishra, P.57, I. 1-3, event compiler with the algorithm) for use in accordance with an event management
- system, the method comprising the steps of:

Art Unit: 2142

automatically generating one or more event relationship network
 from event data, wherein an event relationship network comprises a graphical representation wherein nodes representing events and links connecting correlated nodes (Mishra, Pg.57, I.2-3, 6, Pg.58, I.2-8, compiler converts the event expression in the input and building the graph, the event graph comprises the nodes represent composite events and link represent the path send to the nodes);

Mishra discloses the automatically generating the event relationship network from event data, he fails to mention the utilization of the event graph to construct the correction rules.

However, Yoshida teaches:

utilizing the one or more generated event relationship networks to
construct one or more correlation rules for use by a correlation
engine in the event management system (Yoshida, col.2, l.45-49, in
which the extract patterns corresponds to the event graph, and the
conversion into rules for high speed operation (correlation engine)).

It would have been obvious to one ordinary skilled in the art at the time the invention was made to include the teaching of Yoshida for correlation rule used by the correlation engine.

The motivation would be for Mishra to combine with Yoshida is to achieve the extracting a set of patterns frequently appearing in the graph, evaluating the

Art Unit: 2142

extracted pattern based on the resulting graph size reduction, and outputting a pattern having a good evaluation result (Yoshida, col.1, l.60-65).

3. Claims 2,and 15 are rejected under 35 USC 103(a) as being unpatentable over Mishra D., in view of Yoshida and further in view of Babson et al., (US Patent No. 5345380).

Mishra, and Yoshida teach the event graph generation automatically, and utilize the correlation rule for the correlation engine, but lack of the teaching of human review prior to utilize the event graph.

However, regarding 2, Babson teaches further discloses the method of claim 1, further comprising the step of subjecting the one or more generated event relationship networks to human review prior to utilizing the one or more generated event relationship networks to construct the one or more correlation rules (Babson, col.2, I. 64-67, col. 3, I.1-10, in which the presenting the customer with a plurality of type of nodes, receiving from the customer indication of desired relationships between the desired nodes ).

It would have been obvious to one ordinary skilled in the art at the time the invention was made to include the teaching of Babson for human review prior to correlation engine.

The motivation would be for combining Mishra, and Yoshida to present the event graph to human review to receive from the customer values for parameters to be used with the desired nodes; and construction of a graphical representation of the desired nodes; and to provide the desired service. (Babson, Abstract, col.3, l.5-9)

4. Regarding claim 3, Mishra further discloses the method of claim 1, wherein,

Art Unit: 2142

when one or more previously generated event relationship networks are available, the step of automatically generating one or more event relationship networks comprises:

- obtaining one or more previously generated event relationship networks (Mishra, Pg. 57, I. 10, read rule-definition corresponds to the obtaining the previous event graph);
- validating the one or more previously generated event relationship networks by removing any nodes or links included therein that are incorrect for a particular application context (Mishra, Pg. 57, I.12, define corresponds to the rule event1 and rule-event2, and modify part of the original rule);
- completing the one or more previously generated event relationship networks by adding any nodes or links thereto that are missing for the particular application context (Mishra, Pg. 57, I.18, build-tree corresponds to the completing the event graph);
- outputting the one or more validated and completed event relationship networks as the one or more event relationship networks used to construct the one or more correlation rules (Mishra, Pg. 57, I.14,& I.20, in which the create rule and merge it in the event forest corresponds to the outputting and completed event graph).

Art Unit: 2142

- 5. Claims 4-7, 11,13, 17-20, 24, and 26 are rejected under 35 U.S.C 103(a) as being unpatentable over Mishra in view of Yoshida, and further in view of Yemini et al., (US Patent 6249755).
- 6. Regarding claims 4, Mishra, and Yoshida differ from the claimed invention in that Mishra does not disclose the statistical correlation analysis. However, Yemini further discloses the method of claim 3, wherein the validating and completing steps utilize a statistical correlation analysis (Yemini, col.13, l.10-20).

It would have been obvious to one ordinary skilled in the art at the time the invention was made to include the teaching of Yemini for event correlation analysis by using graphic model (Yemini, col.17, I.40-50 col.24, I.29-37).

The motivation would be for combining Mishra and Yemini is to execute computer code efficiently determining problem events from observable symptoms. (Yemini, Abstract, col.7, I.64-67)

- 7. Regarding claim 5, Yemini further discloses the method of claim 4, wherein the statistical correlation analysis utilizes pairwise correlation analysis, wherein correlation between a pair of events is measured in accordance with one or more statistical measurements (Yemini, col.17, I.59-65).
- 8. Regarding claim 6, Yemini further discloses the method of claim 3, wherein the validating step comprises, for a particular event relationship network, determining that links in the event relationship network have a confidence level not less than a given threshold (Yemini, col.25, l.9-11).
- Regarding claim 7, Yemini further discloses the method of claim 3,

Art Unit: 2142

wherein the validating step, for a particular event relationship network, comprises:

- splitting the event relationship network into correlation paths (Yemini, col.19, l.23-33, in which the classifies corresponds to split);
- for every correlation path, removing a node that has the least number of correlated nodes associated therewith until every node is fully correlated with every other node (Yemini, col.25, I.9-13); and
- merging correlation paths into one or more event relationship networks such that every path in a resulting event relationship network has every node fully correlated with every other node in the path (Yemini, col.17, l.59-65).
- 10. Regarding claim 11, Yemini further discloses the method of claim 1, wherein the event data is obtained from an event log representing historical events associated with a particular system being managed by the event management system (Yemini, col.11, I.32-36, col.24, I.57-67, col.25, I.1-8).
- 11. Regarding claim 13, Yemini further discloses the method of claim 1, wherein the event data is preprocessed prior to use in generating the one or more event relationship networks by removing at least a portion of any redundant events (Yemini, col.8, I.7-10).

Art Unit: 2142

12. Claims 8-10,12, 21-23 and 25 are rejected under 35 U.S.C 103(a) as being unpatentable over Mishra in view of Yoshida, in view of Yemini et al., and further in view of Bettini et al., (Title: Testing complex temporal relationship involving multiple granularities and its application to data mining, 1996 ACM).

As mentioned above, Mishra, Yoshida, and Yemini disclose the limitations of event relationship network, but fail to teach the mining pattern.

- 13. However, regarding claim 8, Bettini further discloses the method of claim 1, wherein, when one or more previously generated event relationship networks are not available, the step of automatically generating one or more event relationship networks comprises:
  - mining patterns from the event data (Bettini, page 74, I.32-50, in which the mining process (mining pattern) derived from event structure (event data) is effective );
  - utilizing the mined patterns to construct the one or more event relationship networks (Bettini, page73, figure 2));
  - outputting the one or more event relationship networks constructed from the mined patterns as the one or more event relationship networks used to construct the one or more correlation rules
     (Bettini, page 74, I.3-5, step 2 gives a general rule to reduce the length of the input event..).

It would have been obvious to one ordinary skilled in the art at the time the invention was made to include the teaching of Bettini for obtaining data mining structure.

Art Unit: 2142

The motivation would be for combining Mishra, Yoshida, Yemini and Bettini is to process data mining in the procedure and find the temporal patterns, i.e. instantiations of the variables in the structure.

- 14. Regarding claim 9, Bettini further discloses the method of claim 8, wherein the constructing step utilizes a statistical correlation analysis to mine patterns (Bettini, page 71, theorem 1, I.30-32 the event X0 occurrence between month in a year is a statistical correlation analysis ).
- 15. Regarding claim 10, Yemini further discloses the method of claim 8, wherein the statistical correlation analysis utilizes pairwise correlation analysis, wherein correlation between a pair of events is measured in accordance with one or more statistical measurements (Bettini, figure 1).
- 16. Regarding claim 12, Mishra further discloses the method of claim 1, wherein the one or more event relationship networks comprise annotations relating to statistical correlation between nodes (Bettini, page 71, figure 1,the annotation on the link between nodes related to statistical correlation).
- 17. Regarding claims 14, 16, 27 have similar limitations as claim 1. Therefore, claims 14,16, 27 are rejected for the same reasons set forth in the rejection of claims 1.
- 18. Regarding claim 15 has similar limitations as claim 2. Therefore, claim 15 is rejected for the same reasons set forth in the rejection of claim.
- 19. Regarding claims 17-20, 24, and 26 have similar limitations as claims 4-7, 11, and 13. Therefore, claims 17-20, 24, and 26 are rejected for the same reasons set forth in the rejection of claims 4-7, 11 and 13.

Art Unit: 2142

20. Regarding claims 21-23, and 25 have similar limitations as claims 8-10, and 12. Therefore, claims 21-23, and 25 are rejected for the same reasons set forth in the rejection of claims 8-10, and 12

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kelvin Lin whose telephone number is 571-272-3898. The examiner can normally be reached on Flexible 4/9/5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Andrew Caldwell can be reached on 571-272-3868. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
